Fruit bats are awake at **night**.
They look for flowers and fruit.

Fruit bats drink **nectar** from
flowers. Pollen gets on their
faces.

Then the bat flies to another flower. The **pollen** on its face gets in the new flower.

When pollen from one flower gets inside another flower, it **pollinates** the flower.

Some **pollinated** flowers grow fruit. Fruit has seeds in it.

Fruit bats like to eat fruit. They also eat the seeds!

Bat poop with seeds in it.

Bats **poop** when they are flying. Seeds from the fruit are in the poop. It lands on the ground.

The seeds in the poop grow new **plants**.

Bats need flowers for nectar.
Flowers need bats for pollination.
This is called **mutualism**.
